Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

New DNA encoding an oviduct-specific glycoprotein - useful frecombinant protein production in high quantities.

Claim 4; Pages 16-18; 22pp; Japanese.
Q90444 encodes R73993 hamster oviduct specific glycoprotein The CDNA can be used for the commercial recombinant prodn. on Boursel of the CDNA can be used for the commercial recombinant prodn. on Boursel of the commercial recombinant prodn.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              WPI; 95-

Q78144 encodes R63441 the Trichoderma harzianum pl endochitinase,

which can be used to inhibit chitin containing fungi and chitin

containing herbivorous insects, especially from the genera below

containing Gliocladium, Rhizoctonia, Trichoderma, Uncinula, Ustilage,

Fusarium, Gliocladium, Rapizoctonia, Sclerotium and Alternaria.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            clone with the Cluster-A gene revealed that these sequences share a high degree of identity (94%). The Cluster-A precursor protien contains a putative signal peptide as well as 4 potential N-linked glycosylation sites (N.X-S/T). The predicted mature protein has a calculated mol. wt. of 39,033 Da.

                                                                                                                                                                                                                                                                                                       The sequence coding for wheat germin, a protein induced during germination of wheat, is a preferred example of DNA coding for protein able to degrade oxalic acid. Such DNA can be coupled to sequence of interest, e.g. one coding for enzymes which confer resistance to pathogens (esp. endochitinases). Plant calli which have been successfully transformed by the sequences are selecte by their ability to grow on oxalic acid-contg. medium. R56861 is a known sequence of a mature endochitinase; the sequence was previously disclosed in EP-531218.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      oxalic acid degradation; oxalate oxidase; filamentous fungus endochitinase; precurso pathogen resistance; plant cell selection

                                                                                                                                                                                                                                                                                                                                                                                        mRNA by screening with anti-chitinase antiserum. Three probes were designed based on the CH3C sequence, corresponding to the start, middle and downstream regions of the coding sequence. The probes were used to isolate the full-length coding sequence of A. album endochitinase from an A. album cDNA library in pTZ19R. A 1.6kb fragment was identified in several positive clones. The sequence of the fragment contained an our encoding a 423 amino acid protein. The mature endochitinase can be used to control pathogens such as fungl, bacteria, arthropods and nematodes on plants.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           LT 9

Chitin biosynthetic enzymes end I, exo I and exo II - are periplasmic chito:dextrinase(s), periplasmic beta-GlcNAcidase(s) and aryl beta-N-acetyl:gluco:amidase(s), respectively Example 4; Page 79-82; 101pp; English.

Periplasmic chitodextrinase (W02156), periplasmic Beta-N-acetylglucosaminidase (W02157) and aryl

Beta-N-acetylglucosaminidase (W02158) can be used to produce chitin are contactively with the structure (GlcNAc)n where n is 2 or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Recombinant DNA encoding fungal endo:chitinase - useful for protecting plants against fungi, insects, etc. Claim 22; Page 60-61; 75pp; French.

This mature protein from the filamentous fungus Aphanocladium album has endochitinase activity and is used to control pathogens such as fungi, bacteria, arthropods and nematodes on plants. Recombinant DNA comprising the endochitinase coding sequence is specifically intended for transforming Nicotiana tabacum, Helianthus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    10-MAR-1993.

                                                                                                                                                                                   Plant cell contg. signal sequence of chitinase A gene - for secretion of foreign polypeptide, esp. chitinase A for protection against pathogenic fungi and nematodes.

Disclosure; Fig. 1A-IC; 20pp; English.
Serratia marcescens QMB1466 genomic DNA was partially digested,
ligated into vector pLAFR1, packaged into lambda phage particles, and used to transfect Escherichia coli DH1 (ATCC 33849) cells.

Plating on chitin medium was used to screen for chitinase activity.

Clone C12 (ATCC 67152) was isolated. Its sequence is given in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               all genes

Inhibition of chitinous fungal plant pathogens - by transforming the chitinase activity plant with DNA encoding chitinase activity plasmid pcHIT1251 containing the chitinase-A gene (chiA), fused directly to a nos promoter, may be used to transform, via Agrobacterium sp., a crop plant. The resulting transgenic plants expressing the chitinase-A protein fragment are protected against fungi, nematodes, insects and disease agents. The protein is fungi, nematodes, insects and disease agents. The protein is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Bacterial chitinase-A fragment from pCHIT1251.

Periplasmic chitodextrinase (W02156), periplasmic
Beta-N-acetylglucosaminidase (W02157) and aryl
Beta-N-acetylglucosaminidase (W02158) can be used to produce chitin oligosaccharides with the structure (GlcNAc)n where n is 2 or higher, by contacting them with soluble chitin. The enzymes are encoded by the genes endi, exoI and exoII respectively. They are allocated in the catabolic pathway of chitin.
                                                                                                                                                                                                                                                  Sequence

Pred. No. 1s the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

submitted to the EMBL Data Library, January 1995
Identification of a 38kba heparin-binding glycoprotein
(gp38k) in differentiating vascular smooth muscle cells
a member of a group of proteins associated with tissue
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                $51327 #type complete

Statistics: Mean 48.978; Variance 85.387; scale 0.574

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
